TITLE of the INVENTION

"Method and device for evaluating the noise associated with turbocodes, and systems using them"

TEXT of the ABSTRACT

In order to evaluate the noise related to data issuing from a turboencoder: estimates of the noise related to its systematic output, to the data
issuing from its first elementary encoder and to the data issuing from its second
elementary encoder are determined (70); at least two of the estimates of the
noise related to the systematic output, to the data issuing from the first encoder,
and to the data issuing from the second encoder, are added (72); the results of
these additions are divided (74) by the number of augends added, and then
inverted (76), so as to obtain a noise factor; and the noise factor is multiplied
with the data issuing from at least one of the first encoder, second encoder and
systematic output.
